## Written Assignment #2

## Vancouver Summer Program - Algorithms - UBC

- You should work with a partner.
- You must typeset your solutions.
- **Notation.**  $\mathbb{N} = \{1, 2, ...\} \subset \{0, 1, 2, ...\} = \mathbb{Z}_+, \text{ and } \mathbb{R}_+ = [0, \infty).$
- 1. We have three containers whose sizes are 10 Liters (L), 7 L, and 4 L, respectively. The 7 L and 4 L containers start out full of water, but the 10 L container is initially empty. We are allowed one type of operation: pouring the contents of one container into another, stopping only when the source container is empty or the destination container is full. We want to know if there is a sequence of pourings that leaves exactly 2 L in the 7 or 4 L container.
  - (i) (5 points) Model this as a graph problem: give a precise definition of the graph involved by clearly explaining the vertices and edges, and state the specific question about this graph that needs to be answered.
  - (ii) (3 points) What algorithm should be applied to solve the problem?
  - (iii) (2 points) Find the answer by applying the algorithm.
- 2. (Some simple graph properties: 5 points.) Let G be a graph with v vertices and e edges. Let M be the maximum degree of the vertices of G, and let m be the minimum degree of the vertices of G. Which of the following propositions must be true? Provide a short proof or counterexample in each case.
  - (a) (1 point)  $2e/v \le M$
  - (b) (1 point)  $2e/v \ge m$
  - (c) (1 point) There exists a simple path (includes no cycles) of length at least m.
  - (d) (1 point) m > 2 implies that G is connected
  - (e) (1 point) In every (simple) graph there is a path from any vertex of odd degree to some other vertex of odd degree.
- 3. (Some more graph properties: 5 points.) Let m be a positive integer and consider a graph  $G^*$  with 2m vertices:  $v_1, \ldots, v_{2m}$ . An edge exists between vertices  $v_i$  and  $v_j$  if and only if  $(i-j\equiv 1 \mod 2m) \vee (i-j\equiv 2m-1 \mod 2m) \vee (i-j\equiv m \mod 2m)$ .

Note that  $x \equiv y \mod n$  if and only if x = kn + y for some integer k. As examples,  $25 \equiv 5 \mod 20$ ,  $29 \equiv -1 \mod 30$  and  $29 \equiv 29 \mod 30$ .

- (a) (3 points) For each  $j \in \{2, ..., 2m\}$ , what is the distance between  $v_1$  and  $v_j$ ? The distance between two vertices of a graph is the number of edges on the shortest path that connects the two vertices. (Derive an expression in terms of i, j and m. You will have to consider a few cases.)
- (b) (2 points) A graph G is k-edge-connected if and only if one has to remove k edges to disconnect the graph. Prove that  $G^*$  is not 4-edge-connected: you can remove three or fewer edges to disconnect the graph.
